**Question** What is probability in grade 7 math? Probability is a measure of how likely an event is to happen, usually expressed as a number between 0 and 1 or as a percentage. How do you calculate the probability of an event? To calculate probability, divide the number of favorable outcomes by the total number of possible outcomes. For example, if you have 3 red balls out of 10, the probability of drawing a red ball is  $3/10$ . What is the difference between theoretical and experimental probability? Theoretical probability is based on the expected likelihood of an event happening, while experimental probability is based on actual experiments or trials conducted. Can you give an example of calculating probability in a real-life situation? Sure! If you roll a fair six-sided die, the probability of getting a 4 is  $1/6$  because there is one 4 on the die and six possible outcomes. Why is understanding probability important for grade 7 students? Understanding probability helps students make informed predictions, analyze data, and understand chance, which are useful skills in everyday life and future studies.

It is expressed as a number between 0 and 1, where 0 indicates impossibility, and 1 indicates certainty. Understanding probability enables students to model real-world situations involving uncertainty, such as predicting outcomes in games, experiments, or data analysis.

### Importance of Probability in IB Math

- Develops critical thinking and decision-making skills
- Enhances understanding of data and statistics
- Prepares students for higher-level mathematics and real-world applications
- Integral for topics like combinatorics, random variables, and statistical inference

### Core Concepts of IB Math Probability

#### Basic Probability Principles

- Sample Space (S): The set of all possible outcomes of a random experiment.
- Event (E): A subset of the sample space, representing outcomes of interest.
- Probability of an Event (P(E)): The ratio of favorable outcomes to total outcomes, assuming equally likely outcomes.

#### Formula:

$$P(E) = \frac{\text{Number of favorable outcomes}}{\text{Total number of outcomes}}$$

Note: For non-uniform probability distributions, different methods are employed.

### Types of Probability

- Theoretical Probability: Based on known possible outcomes.
- Experimental Probability: Derived from conducting experiments or simulations.
- Subjective Probability: Based on personal judgment or belief.

### Fundamental Rules of Probability

#### Addition Rule

Used when calculating the probability that at least one of two events occurs.

- For mutually exclusive events (events that cannot happen simultaneously):

$$P(A \cup B) = P(A) + P(B)$$

- For non-mutually exclusive events:

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

#### Multiplication Rule

Used to find the probability that both events occur.

- For independent events (the outcome of one does not affect the other):

$$P(A \cap B) = P(A) \times P(B)$$

- For dependent events:

$$P(A \cap B) = P(A) \times P(B|A)$$

where  $P(B|A)$  is the probability of B given A has occurred.

## Conditional Probability and Independence

### Conditional Probability

The probability of event B occurring given that event A has already occurred:

$$P(B|A) = \frac{P(A \cap B)}{P(A)}$$

This concept is crucial when analyzing dependent events.

### Independence of Events

Two events A and B are independent if:

$$P(A \cap B) = P(A) \times P(B)$$

If this condition is not met, the events are dependent.

## Discrete Random Variables and Probability Distributions

### Discrete Random Variables

Variables that take specific values, often counts or integers, with associated probabilities.

### Probability Distributions

- Probability Mass Function (PMF): Assigns probabilities to each possible value.
- Expected Value (Mean): The average outcome of a random variable.

$$E(X) = \sum x \times P(X = x)$$

- Variance: Measures the spread of the distribution.

$$\text{Var}(X) = E[(X - E(X))^2]$$

## Common Probability Distributions in IB Math

### Binomial Distribution

Models the number of successes in a fixed number of independent trials with the same probability of success.

Conditions:

- Fixed number of trials  $(n)$
- Two possible outcomes (success/failure)
- Independence between trials
- Constant probability of success  $(p)$

Probability Mass Function:

$$P(X = k) = \binom{n}{k} p^k (1-p)^{n-k}$$

where  $(k)$  is the number of successes.

### Geometric Distribution

Models the number of trials until the first success.

Probability:

$$P(X = k) = (1 - p)^{k-1} p$$

where  $(k \geq 1)$ .

### Poisson Distribution

Models the number of events occurring in a fixed interval or space when events occur independently at a constant average rate  $(\lambda)$ .

Probability:

$$P(X = k) = \frac{\lambda^k e^{-\lambda}}{k!}$$

Question: A biased coin has a probability of heads ( $p = 0.6$ ). If the coin is flipped 10 times, what is the probability of getting exactly 6 heads?

Solution:

- Recognize the binomial distribution applies.
- Use the binomial PMF:

$$P(X = 6) = \binom{10}{6} (0.6)^6 (0.4)^4$$
