In this article, we will explore the fundamentals of solubility, delve into common POGIL activities related to solubility, provide detailed answer keys, and highlight strategies to master this important chemistry concept.

Understanding Solubility: The Fundamentals

What Is Solubility?

Solubility refers to the maximum amount of a substance (solute) that can dissolve in a given amount of solvent at a specific temperature, resulting in a saturated solution. It is typically expressed in units such as grams per 100 milliliters (g/100 mL), molarity (mol/L), or molality (mol/kg).

Factors Affecting Solubility

- **Temperature:** Usually, increasing temperature increases solubility for most solids and liquids, but exceptions exist, especially with gases.
- **Nature of the solute and solvent:** "Like dissolves like" ? polar solutes tend to dissolve in polar solvents, nonpolar in nonpolar.
- **Pressure:** Significant for gases; increasing pressure increases gas solubility.
- **Presence of other substances:** Common ion effect and complex formation can influence solubility.

Types of Solubility

- **Soluble:** Substances that dissolve readily in a solvent (e.g., NaCl in water).
- **Insoluble:** Substances that do not dissolve appreciably.
- **Slightly soluble:** Substances with limited solubility, forming saturated solutions.

Common Solubility Rules and Guidelines

Solubility Rules for Ionic Compounds

These rules help predict whether an ionic compound will dissolve in water:

- Most salts containing alkali metal ions (Li^+ , Na^+ , K^+ , Cs^+ , Rb^+) are soluble.
- Nitrates (NO_3^-), acetates (CH_3COO^-), and chlorates (ClO_3^-) are generally soluble.
- Chlorides, bromides, and iodides are soluble except those containing Ag^+ , Pb^{2+} , and Hg_2^{2+} .
- Sulfates are soluble except BaSO_4 , PbSO_4 , and CaSO_4 .
- Most carbonates, phosphates, silicates, and sulfides are insoluble, except those containing alkali metals or ammonium.

Answer: Yes, NaCl is highly soluble in water because it is an ionic compound containing alkali metal ions, which are generally soluble according to the solubility rules.

Question 2: Which of the following compounds is insoluble in water? a) AgCl , b) KNO_3 , c) Na_2SO_4

Answer: a) AgCl . Silver chloride is insoluble in water, whereas potassium nitrate and sodium sulfate are soluble.

Question 3: How does increasing temperature affect the solubility of solids in liquids?

Answer: Generally, increasing temperature increases the solubility of solids in liquids because higher temperatures provide more energy to break intermolecular forces, allowing more solute to dissolve.
